MEET APP

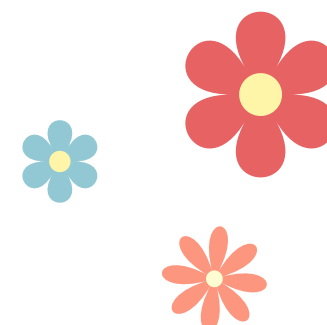

OVERVIEW

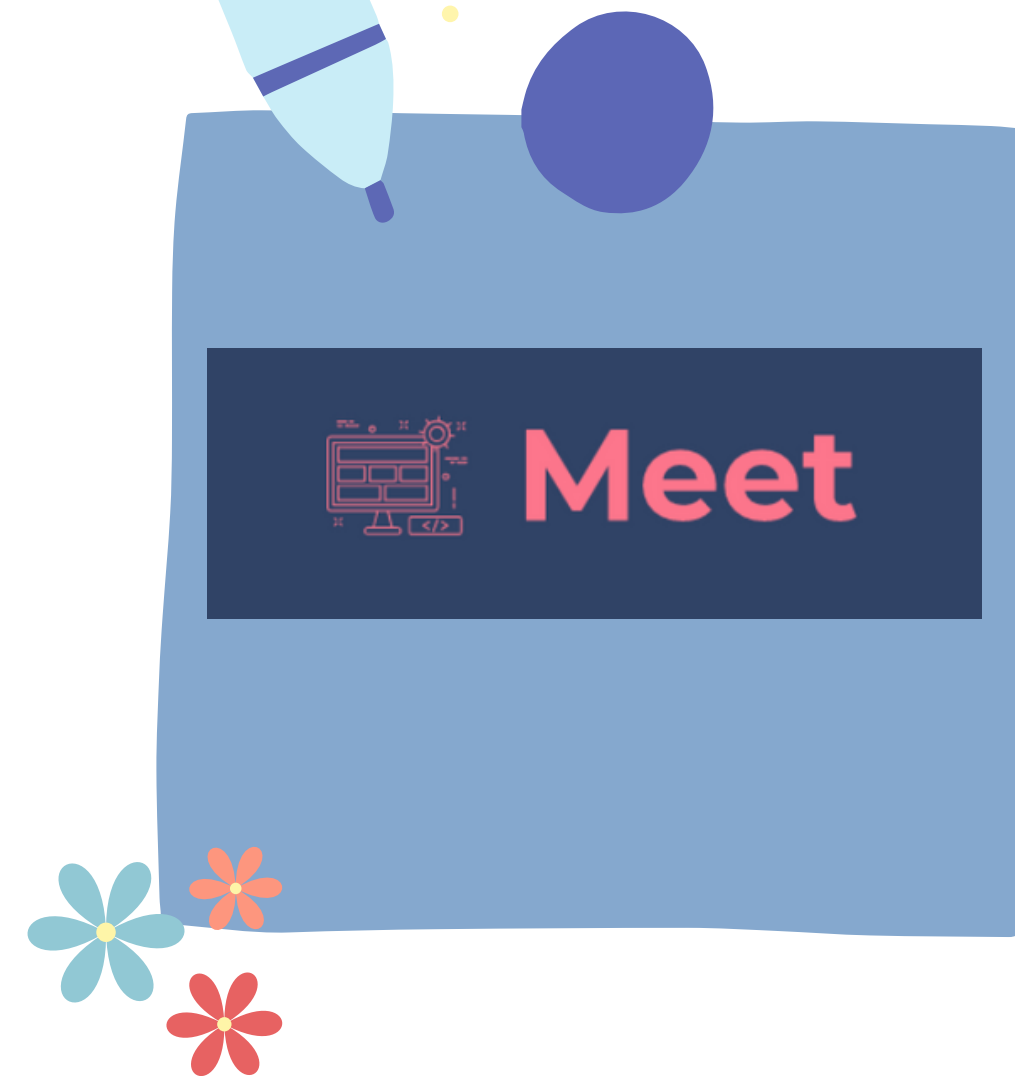

Meet App is a progressive web app with the ability to work offline and a serverless backend developed using a Test-Driven Development (TDD) technique where I write tests before writing the actual functionality. Users of this app will be able to use it whenever they want to view upcoming events for a specific city. Users may be able to install the app on desktop and add the app to their home screen on mobile

OBJECTIVE

The objective is to build a serverless, progressive web application with React using a test-driven technique. The application uses the Google Calendar API to fetch upcoming events.

PROCESS

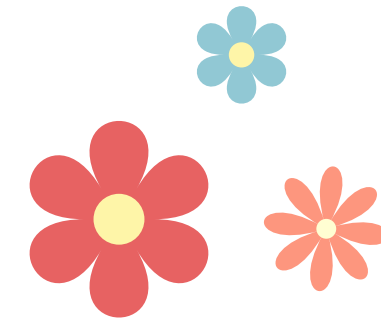

- Written with Node/Express as Lambda functions (FaaS); hosted on AWS.
- Uses external API provided by Google Calendar to retrieve data
- Implemented OAuth2 token for Authentication and Authorization by creating Google OAuth.
- code and test using unit test, the integration test, acceptance test, end-to-end test.

- Implemented a feature in the web app using OOP and React class components
- Implemented progressive functionality into an existing app, so that the app can be used offline and added to a user's home screen
- Implemented Progressive Web App (PWA) for offline capability

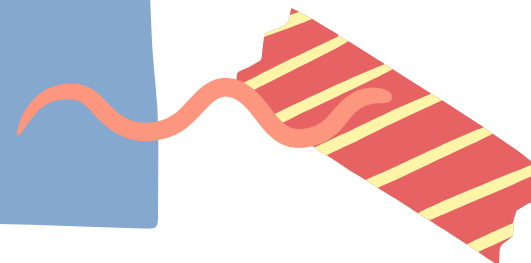

TESTING

- It took me long to finish the task since I was coding at the same time I was testing with the following key features.
- tested using the different types of testing: Unit Testing, Integration Testing, Acceptance Testing and End-to-End Testing, test-driven development (TDD) and behavior-driven development (BDD).

KEY FEATURES

- **Filter Events by City.**
- **Show/Hide Event Details.**
- **Specify Number of Events.**
- **Use the App When Offline.**
- **Add an App Shortcut to the Home Screen.**
- **Display Charts Visualizing Event Details.**

TOOLS

- **React**
- **WS lambda**
- **Node/ Express**
- **Google Calendar API**
- **GitHub**
- **Jest- Cucumber**
- **eslint**
- **Vercel**
- **Puppeteer**
- **Atatus**
- **Vite**
- **Recharts**
- **Node.js**
